

Leaf Cross Biomedical Front-End Extraction Summary

Scope and Objectives

The goal is to capture all assets and metadata required to reproduce the **public-facing** portion of leafcross.com in a new Next.js application. Only customer-visible pages (Home, About, Brands, Services, Retailers, B2B Clients, Contact, Blog, Privacy Policy, Terms of Use, and the monthly subscription section) are in scope. The Veterans and Medical Patients workflows will not be included in the rebuild.

This report summarises the findings from a read-only audit of the WordPress backend. It records media assets, navigation structure, Elementor global settings, WooCommerce data, and other relevant details. No live content or settings were altered during the audit.

Pages to Retain

The following pages will be re-implemented in Next.js. Slugs and notes are provided for reference:

WordPress page	Slug/URL	Notes
Home	/	Contains hero section, product highlights, and a rotating 3D nug/flower animation.
About	/about	Company overview page.
Brands	/brands	Grid of brand/product logos; includes product categories.
Services	/services	Describes services offered (manufacturing, wholesale, etc.).
Retailers	/retailers	Landing page for licensed retailers.
B2B Clients	/b2b-clients	Describes wholesale/bulk opportunities.
Contact	/contact	Contact form built with Elementor.
Blog	/blog	List of posts; individual posts use the default single post template.
Privacy Policy	/privacy-policy	Legal text.
Terms of Use	/terms-of-use	Legal text.

WordPress page	Slug/URL	Notes
Subscription Plan	/subscription-plan/	Contains the monthly subscription/membership selector via shortcode <code>[ihc-select-level]</code> ¹ .
Age Verification	Popup	A modal age gate appears on first visit asking users to confirm they are at least 19 years old. The overlay blocks the site until "Yes, I am 19+" is clicked. It is implemented via a plugin rather than Elementor.

Pages related to **Veterans** and **Medical Patients** (registration forms, login portals, and medical workflows) are intentionally **excluded** from the rebuild.

Media Assets

All images, banners, GIFs, and key graphics were enumerated via the WordPress REST API. The important assets and their usage locations were compiled into a CSV file (`media_urls.csv`) stored in the `leafcross-extract/media` folder. Each entry lists the filename, source URL and the page or feature where the asset appears (home hero, carousel, blog image, product banner, etc.). For example:

- **Home banners** – large 1920×650 PNGs used in the home hero section; file names `LCB-Banners-1920...png` etc. These are not attached to a specific page and act as global banners ².
- **Product images** – `OG-Kush-x-Sour-Diesel-3.png`, `FLAWLESS-VIC.png` and others are used on product cards and brand pages ³ ⁴.
- **Slider images** – `5-2.png`, `4-2.png`, `3-2.png`, `2-2.png` belong to the image carousel on the **Medical Patients Shop** page but can also be repurposed for the home gallery ⁵.
- **Blog images** – several stock photos such as `pexels-liza-summer-6382642-scaled.jpg` and `cbg-anxiety-neurosiceince.jpg.webp` illustrate blog posts ⁶.
- **Animated assets** – `Free-Shipping-GIF.gif` is a 1920×650 GIF used on promotional banners ⁷.

The CSV and the previously delivered `leafcross_images.zip` provide the raw files. These files should be placed in `public` or an asset server when building the Next.js front-end.

Elementor Templates

During the audit there were **no saved header or footer templates** inside Elementor's Theme Builder; both sections are managed by a separate plugin (`Elementor Header & Footer Builder`) and the active Hello Elementor theme. Because of this, there were no JSON templates available for export in the WordPress admin. Each page (Home, About, Brands, etc.) is built directly on the page rather than via reusable templates. For the rebuild, replicate each page's layout manually using the retained assets.

The age verification popup and the subscription plan selector are also **not** Elementor popups; they are generated via dedicated plugins, so no Elementor JSON exists for them.

Global Styles and Custom CSS

Elementor site settings reveal a minimal design system:

- **Global colors** – Primary, Text and Accent colours are white (`#FFFFFF`) and the Secondary colour is dark (`#191919`). No custom colours were defined ⁸ .
- **Global fonts** – The site did not define custom font families in the global settings. Examination of the front-end CSS shows headings use a bold sans-serif typeface similar to *Montserrat* or *Poppins*, while body text uses a clean sans-serif font. These fonts should be specified in the Next.js project's global styles.
- **Custom CSS** – There is no site-wide custom CSS defined in Elementor. However, additional CSS may exist in the theme's `style.css` or the WP Customizer. The Hello Elementor theme primarily provides basic resets, so the new project should implement its own styles.

Navigation, Header and Footer Structure

- **Header** – Contains the Leaf Cross logo on the left, main navigation links (Retailers, B2B Clients, Medical Patients, Veterans, Brands), and a “Contact Us” button on the right. On smaller screens the navigation collapses into a hamburger menu. The header is controlled by `Elementor Header & Footer Builder` rather than Elementor's Theme Builder.
- **Navigation** – The top-level menu items link to the pages listed in the **Pages to Retain** section. Several menu items (Medical Patients, Veterans) point to pages that will be removed from the rebuild.
- **Footer** – Contains the site logo, a navigation column repeating the main links, contact information (email and phone number), legal links (Privacy Policy and Terms of Use) and social icons (LinkedIn, Facebook, Instagram). The footer uses the dark secondary colour background and white text and is implemented via the header/footer builder plugin rather than Elementor templates.

WooCommerce Product Data

WooCommerce products can be queried via the public Store API endpoint (`/wp-json/wc/store/products`). Each product includes fields such as `id`, `name`, `prices`, `categories`, `images` and `variations` ⁹ . The built-in WooCommerce product exporter in WP Admin successfully generated a CSV (`wc-product-export-...`) but downloading through the browser is restricted. A manual product inventory was therefore compiled using the API and the admin product list:

- **Total products:** 41 (most are private or draft). Categories include *All Day Cannabis*, *CBD*, *Flower*, *Sativa*, *Indica*, *Hybrid*, *Medical Patents* and others ¹⁰ .
- **Variable products:** Many products (e.g., *Grass Dance PR Lot SCC14481* and *Super Lemon Haze*) have size-based variations with case quantities and pricing ranges ¹¹ .
- **Subscription products:** None identified; the monthly subscription plan is handled by the membership plugin (`Ultimate Membership Pro`), not WooCommerce.

A simplified CSV (`product_list.csv`) summarising product names, slugs, categories and price ranges is provided in the `exports` folder.

WordPress XML Export

The standard WordPress **Tools > Export** option is not available for the `55bre` user role, and the WebToffee export plugin operates only on products. Consequently, a complete XML export of pages/posts could not be generated. However, the Next.js rebuild will not import WordPress content directly; instead, replicate the page structures and copy any necessary copywriting manually.

Age Verification Popup

On first visit a modal dialog appears asking, “**Are you 19 +?**” with Yes/No buttons. It darkens the page and prevents interaction until “Yes” is selected. Selecting “No” redirects to a non-restricted domain (or simply reloads). The popup is created by an age-verification plugin (likely *Age Gate* or similar) rather than Elementor. In the rebuild, implement a client-side modal that sets a cookie or localStorage flag once confirmed. The modal should display on every page until the user confirms they are 19 or older.

Monthly Subscription Feature

The **Subscription Plan** page uses the shortcode `[ihc-select-level]`, which belongs to the **Ultimate Membership Pro** plugin (IHC). When rendered, the shortcode outputs a membership plan selector that allows customers to choose a membership level and proceed to checkout. No product is sold; instead, the plugin manages subscription billing and user roles. To replicate this feature in Next.js, implement a subscription component that queries available membership plans via an API (or static data) and integrates with the chosen payment gateway for recurring payments.

Revolving 3D Nug / Animation

The home page features a rotating 3D cannabis nug visual. Inspection of the page markup shows the element is produced by a JavaScript library loaded by the *Slider Revolution* plugin. The 3D nug is rendered as an animated SVG or WebGL canvas inside the slider. For the Next.js rebuild, this effect can be recreated using a lightweight 3D library such as Three.js or a CSS animation on an SVG sequence. Ensure the asset is optimised to avoid impacting performance.

Files in `leafcross-extract` Folder

The `leafcross-extract` folder (included with this report) contains subfolders to organise the extracted assets:

- **media/** – downloaded images and banners used on the site.
- **templates/** – (empty) no Elementor templates were available for export.
- **screenshots/** – placeholder; screenshots were provided in the audit report but not downloaded as files.
- **exports/** – includes `media_urls.csv` and `product_list.csv`. The WooCommerce export CSV could not be retrieved due to environment restrictions.
- **css/** – contains a brief `global_styles.md` file summarising the global colours and fonts.
- **reports/** – this `rebuild_report.md` document.

Migration Recommendations

- **Use a headless CMS:** Since the client does not need the WordPress backend for customers, consider migrating content into a headless CMS (e.g., Sanity, Strapi) or Markdown files. This simplifies deployment and allows content editing without WordPress.
- **Implement responsive design:** Use CSS Grid/Flexbox to replicate the existing layouts. Pay attention to dark backgrounds and neon accent colours. Recreate the header/footer with accessible navigation.
- **Rebuild membership and age gate:** Implement the age-verification modal and membership subscription selector natively in React/Next.js. Integrate with the chosen payment service for recurring charges.
- **Optimise assets:** Compress high-resolution banner images and convert them to WebP. Lazy-load offscreen images to improve page speed.
- **Test across devices:** Capture full-page screenshots of each retained page on desktop and mobile to ensure fidelity. These can be taken using headless browsers during development.
